Where we are now

02 October 2026 · Prepared for Arshad Ashraf · Confidential

1. Opening note

I am writing to confirm that **build work on Study Loop has started**. We now have a working version of the platform running on our side, and we have begun testing the main student journey end to end — signing in, practising questions, getting marks, completing a placement check, sitting a mock paper, and using the early AI tutor features.

One important note up front: **the screens and overall look-and-feel are not finished yet**. Some pages work behind the scenes but still look rough or incomplete on screen. So this update is about what has been **tested and proven to work**, not a claim that the product is ready to show parents or students as a finished experience.

TESTED & WORKING	NEXT UP	LATER
Core learning journey proven	Make the screens presentable	Live AI polish, schools, app

2. What is done (tested and working)

Only items we have actually tested are listed here as done. If something has not been properly tested yet, it is treated as incomplete — even if some of the work has begun.

Area	Status	In plain terms
Platform set-up	**Done**	The system is up and running on our side so we can build and test features properly.
Parent sign-up & login	**Done**	A parent can register, verify their email, and sign in.
Child / student login	**Done**	A student can sign in with their handle and picture PIN and reach their home screen.
Student home & subject enrolment	**Done**	The student can see they are enrolled and start learning from home.
Practice questions (multiple choice / calculation)	**Done**	A student can start practice, answer, and receive a final mark.
Written answers & marking	**Done**	Written answers can be marked and the marks page now loads after fixes we made during testing.
Placement diagnostic	**Done**	The short placement check runs: answer a question and move to the next one.
Mock exam paper	**Done**	A student can create a practice mock, sit it, submit, and see a result.
AI tutor chat (early version)	**Done***	Chat sessions start, basic safety blocking works, and a parent can turn chat off. Replies are still test/stub quality — not the final live AI yet.
Voice tutor (early wiring)	**Done***	We have checked that a voice session can be started and ended. Full live spoken conversation quality is still ahead.
Progress / knowledge map	**Done**	After practice, the student's topic map updates so progress is visible.

Revision notes	**Done**	Seeded revision notes and cheat-sheets can be opened for topics we have loaded.

* Early version = the feature path works in testing, but the final live AI quality and polish are still to come.

3. What is still incomplete

These are not ready to treat as finished. Some may have early work started, but they have not been fully tested — or the screen experience is still poor.

Area	Status	In plain terms
Look and feel of the website	**Incomplete**	This is the main gap. Screens exist, but many still look unfinished, empty, or rough. Not ready for a polished client demo yet.
Live AI marking & tutoring quality	**Incomplete**	We are still on a test AI set-up. The real model quality (including your 95% marking target) has not been measured yet.
Photo / camera marking of handwritten work	**Incomplete**	Not switched on for real scoring yet.
Some learning screens (plan, redrill, surprise quiz)	**Incomplete**	Parts work behind the scenes, but the pages students see still need finishing.
Full payments / subscriptions	**Incomplete**	Early payment set-up exists; the full subscribe / cancel journey still needs finishing and testing.
School / B2B side	**Incomplete**	Needed for launch alongside direct-to-consumer, but not deeply tested yet.
Staff tools (content & review teams)	**Incomplete**	Some review tools exist; the wider staff toolkit still needs work and testing.
Parent area polish	**Incomplete**	Core parent actions work; the parent experience still needs finishing.
Mobile app	**Incomplete**	Agreed in scope (app and web). Web is first; the app comes later.
Google / social login	**Incomplete**	Not in the current build.

4. About the screens (important)

> Please treat the current website as a **work in progress**. We have proven a lot of the learning journey works under the surface, but the screens are not yet something I would ask you to show families as the finished product. Making the experience clear, tidy, and trustworthy is the next priority.

5. Suggested next milestones

This is the order I recommend so you can see progress clearly week by week.

Milestone	What you should be able to see
Milestone 1 — Student screens usable	A clean walkthrough: student signs in, practises, gets marks, completes diagnostic, and opens a mock — without rough/empty screens getting in the way.
Milestone 2 — Parent walkthrough	Parent can set up a child, manage basic controls, and move through the main payment happy path more smoothly.
Milestone 3 — Live AI switched on	Move off the test AI set-up and start judging real marking and tutor quality against the pilot goals (including 95%+ marking accuracy).

Milestone 4 — Remaining product tracks	School channel, wider staff tools, photo marking, and mobile — building on a demoable student/parent loop.

I will keep reporting in the same way going forward: **tested = done**, and anything not properly tested stays incomplete.
