EXAM-PREP PLATFORM — SUMMARY BRIEF

What we're building, in plain terms — no technical detail

The idea, in one sentence

We're building an online platform where parents sign their children up for exam revision — practice questions, mock tests, instant marking and progress tracking — modelled on a proven UK product that already does this well, but taken further and made distinctly ours.

What already exists: Atom Learning

Atom Learning is a well-established UK platform that parents pay a monthly or annual subscription for. Children aged 7–16 use it to prepare for:

- 11+ and grammar/independent school entrance exams
- Year 6 SATs
- GCSEs

Its core promise is simple: as many practice tests as a child wants, marked instantly, with clear reporting so parents can see exactly how their child is progressing before the real exam.

You can see the existing site here: atomlearning.com.

What we're building

In short: we want what Atom Learning already offers, rebuilt as our own product, with everything they do kept in and several genuine improvements added on top. Nothing is being stripped back — we're starting from a proven foundation, not a blank page.

- Same core offer parents already trust: subscriptions, unlimited practice, instant marking, progress tracking.
- Extended age range: Atom stops at GCSE (age 16). We're taking it all the way through to A Level (age 18), so one platform covers a child's entire school journey.
- One standout new feature (below), plus a set of smaller improvements to design, trust and pricing.

The one big new idea: practice that never runs out

Every exam board only publishes a limited number of real past papers. Sooner or later, a motivated student runs out of authentic material to practise on.

Our platform solves that. It can generate brand-new practice questions and full mock papers on demand — written and marked in the same style and standard as the real exam — so a student can simply keep practising a topic, or keep sitting fresh mock papers, for as long as they need to. This is the single feature that sets us apart from Atom Learning and other competitors, and it's the one most worth investing in first.

Other improvements we're adding

- Bite-sized flashcards and quick topic quizzes, for lighter revision between longer practice sessions.
- In-the-moment explanations shown as soon as a student gets something wrong, rather than just a right/wrong mark.

- A distinct look and feel, so the platform doesn't read as a copy of anything else.
- More honest, transparent reporting of results for parents, instead of a single headline statistic.
- Family-friendly pricing for households with more than one child.

> ***A full, detailed build specification exists separately for the development team — this brief is deliberately the short, plain-English version for everyone else.***

How we'll get there

Rather than building everything at once, the plan is to prove the idea on a small scale first, then widen it out. This keeps early spend low and lets us learn from real feedback before committing to the full build.

- Start with one or two subjects as a pilot, to prove the new practice-question feature works well and is trustworthy.
- Roll it out across all the subjects and age groups Atom Learning already covers, then extend up into A Level.
- Layer on the smaller improvements — flashcards, design, pricing, reporting — alongside, as time allows.

Why this approach

Copying a proven product's structure removes most of the guesswork: we already know parents will pay for this kind of platform, and we know roughly what “good” looks like. The unlimited AI-generated practice feature is what gives us a genuine reason for a parent to choose us over the existing options, rather than just competing on price or marketing alone.

Questions? This brief is a summary — ask if you'd like more detail on any part.
